

## AIRCRAFT DISINFECTING & DECONTAMINATION SERVICES

Protect your aircraft with our multi-layered approach by choosing one or more of the following services:

### Air Purification Treatment

First, we decontaminate the aircraft by placing our professional grade UV Ozone Generator inside the cabin to run for one to two hours. This unit is designed for deodorizing and purifying interiors on a molecular level. The UV-C light element, in proper wavelength, filters out and eliminates bacteria and viruses, as well as malodors. It is Honeywell-approved and safe to use inside the aircraft. Upon completion, the cabin is ventilated with fresh air.

### Interior Disinfectant Wipe Down

We then clean the entire aircraft interior by wiping down and disinfecting all areas using our EPA registered disinfectant (Celeste Sani-cide EX3, EPA Reg. #42048-4) which is also an all-purpose cleaner. It is eco-friendly and will not adversely affect any interior surfaces.

### ULV Fog System Disinfectant Treatment

We finish the interior detailing by activating our ULV Fog System Treatment using Celeste Sani-cide EX3 to completely fumigate the atmosphere inside the aircraft. We then vacuum the entire interior.

### Anti-microbial Barrier Treatment

As a final step, we can offer an extra layer of protection with an anti-microbial barrier treatment (ClearCabin powered by PreventX) that has an efficacy of 90 days on all the high traffic touch points in the aircraft. This provides you long-lasting protection. When applied, this treatment arrests the growth of microorganisms and harmful bacteria. Once the microbes come in contact with a treated surface, the cell walls are physically ruptured, thereby killing them. This treatment is effective against many enveloped and non-enveloped viruses and gives you peace of mind in knowing that there is a system constantly working in the background that will protect everyone onboard.
